04. Stage Lights DMX Templates for Live FX - Downloads

In the Stage Lights module in **Live FX** you can patch various functions from a Lighting Console. To patch these functions you can use a template or program the function from scratch, using a DMX table. The available functions and layout of the patches differ, depending on the Live FX version used. Below you can download the GDTF template or DMX table for a specific version. Note that for ETC consoles, the templates are available from the console manufacturer. Currently only the 9.7 templates are available. The v9.8 version is in the process of being validated.

Live FX - Stage Lights v9.8

- DMX Table + GDTF Profiles
- Changes. Added a profile for controlling a Switcher node to select one or more sources to color sample from as well as set the in/out point and vari-speed of the source clip. The Lightcard profile now only contains a single lightcard reference. To patch multiple lightcards, you simply create multiple patches instead of using the single patch form the previous version that contained 10 references by default. In the Sampler profile, the color-range patches have been removed to make it more straight forward profile, purely targeted on sampling color.

Live FX - Stage Lights v9.7

- DMX Table + GDTF Profiles
